

The software is developed using C++ and Matlab

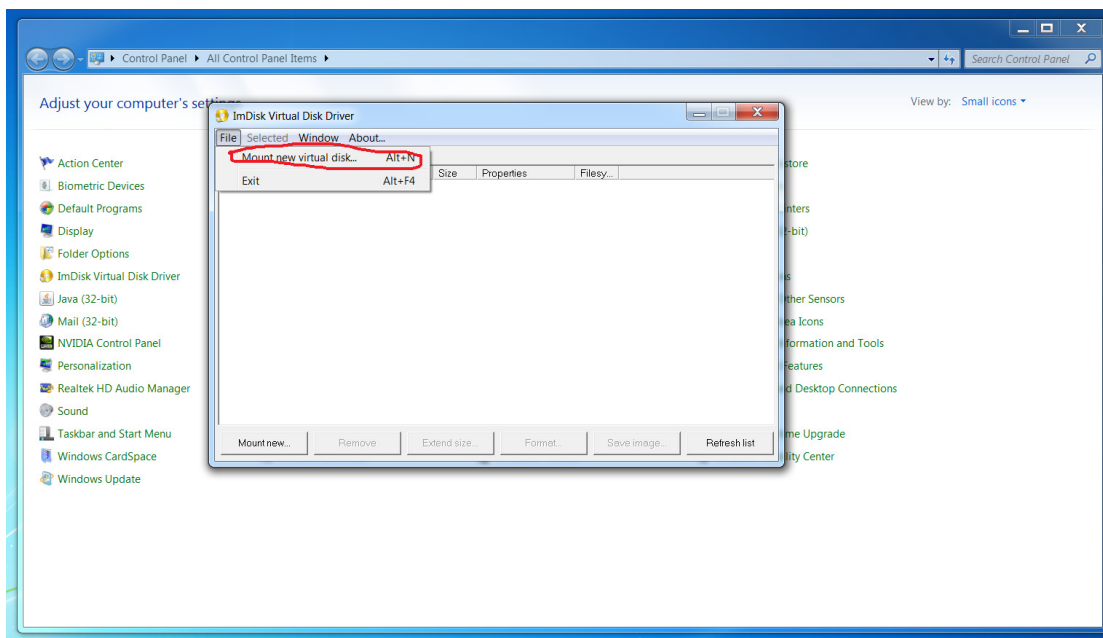

To use the software, first you need to use imdisk to create virtual disk from computer memory, which is used for communication between Matlab and C++ programs.

Attention: At Each time you start your computer, you need to do this, because the virtual disk will be cleared after you shut down the computer.

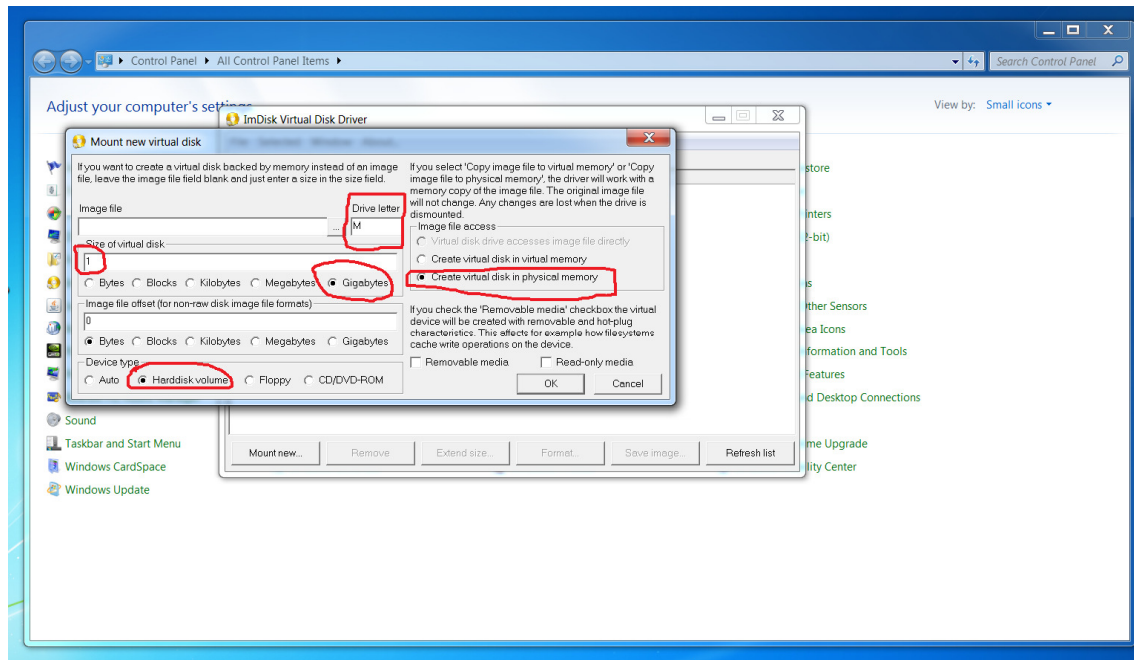

I assume you have installed imdisk. and then, open control panel of windows 7

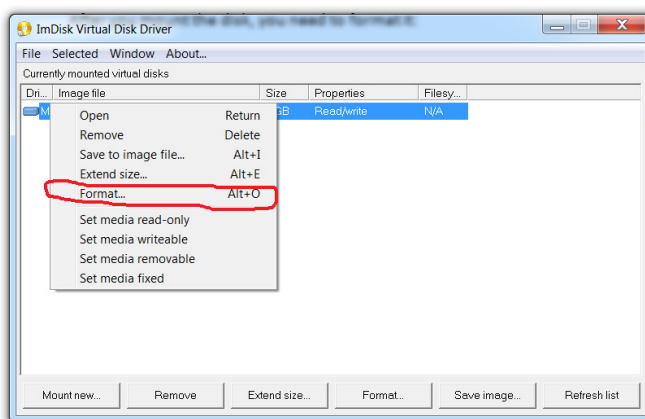

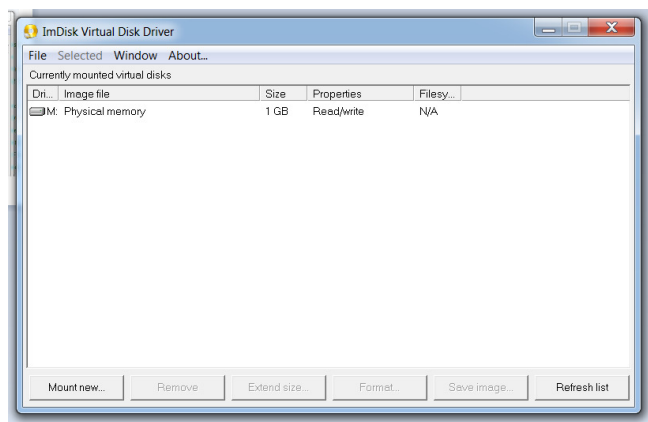

Click imdisk virtual disk driver, and select mount new virtual disk

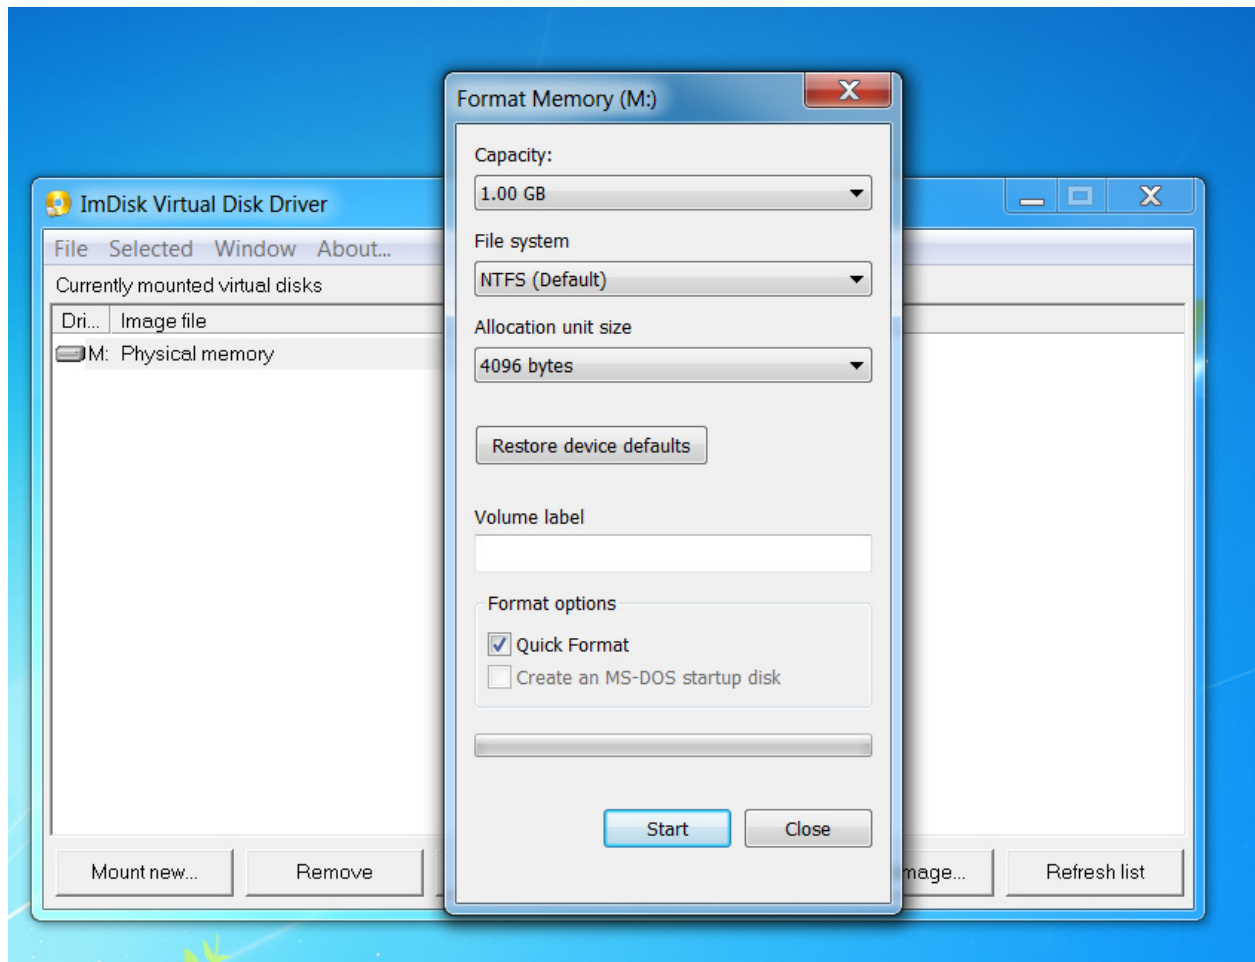

Make sure you do the same thing as shown in this figure, and then click OK.

After you mount the disk, you need to format it:

Click start, and wait.
